Background: Preprints often wait months before their authors choose a journal. We tested whether a personal, pre-filled submission page shortens that wait.

Methods: We screened 11,408 bioRxiv and medRxiv preprints posted over two years against the scope of GenoMed Connect, removed those already published, and built a page for each remaining corresponding author with the title, authors and abstract filled in.

Results: 1,885 authors were ready to invite. Submitting takes three ticks and one button, about a minute, and the editorial office prepares the JAMS submission for the author to confirm.

Conclusions: Submitting a preprint can be quick. Further studies, and more coffee for the editorial office, are needed.

Keywords: preprints; open access; editorial workflow; GenoMed Connect; one-click submission

1. Introduction

Many preprints are posted before the authors have chosen a journal. Choosing one, preparing the files and filling in a submission form takes time, and some papers stay on the preprint server for months.

This pilot asks a simple question: if the journal prepares the submission and the author only confirms it, do more authors submit? Figure 1 shows how the invitation list was built.

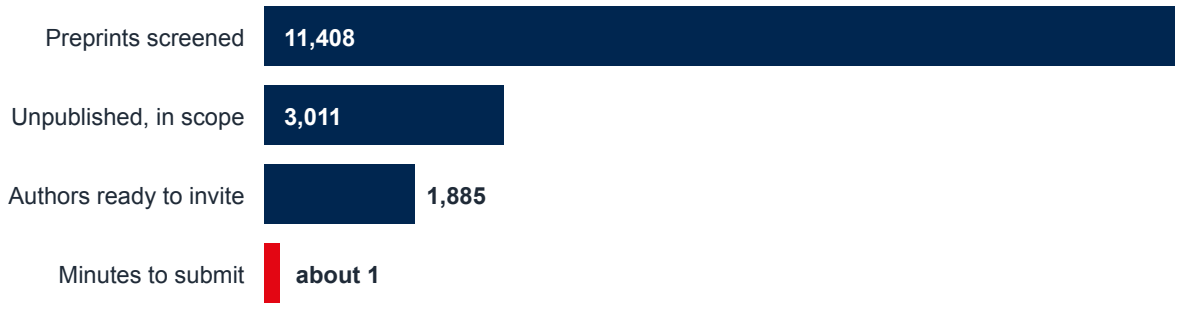

Figure 1. From the two-year preprint pool to the invitation list (GenoMed Connect, 14 October 2026).
